You don't have to be a compiler engineer to work on Python – Savannah Ostrowski

How you can contribute today

Increase test coverage

- ◆ Read devguide.python.org/testing/coverage
- ◆ Compile CPython locally
- ◆ Run coverage.py
- ◆ Write a test

```
1562 |         return obj_type(*[_asdict_inner(v, dict_factory) for v in obj])
1563 |     else:
1564 |         return obj_type(_asdict_inner(v, dict_factory) for v in obj)
1565 |     elif isinstance(obj_type, (dict, frozendict)):
1566 |         if hasattr(obj_type, 'default_factory'):
1567 |             # obj is a defaultdict, which has a different constructor from
1568 |             # dict as it requires the default factory as its first arg.
1569 |             result = obj_type(obj.default_factory)
1570 |             for k, v in obj.items():
1571 |                 result[_asdict_inner(k, dict_factory)] = _asdict_inner(v, dict_factory)
1572 |             return result
1573 |         return obj_type(( _asdict_inner(k, dict_factory),
1574 |                          _asdict_inner(v, dict_factory))
1575 |                          for k, v in obj.items())
1576 |     elif isinstance(obj_type, list):
1577 |         # Assume we can create an object of this type by passing in a
1578 |         # generator
1579 |         return obj_type( _asdict_inner(v, dict_factory) for v in obj)
1580 |     else:
1581 |         return copy.deepcopy(obj)
1582 |
1583 |
```

How you can contribute today

- ◆ Lots of low-hanging fruit 🍒
- ◆ Start by reading issue [#4641](#)

- ◆ Can it be reproduced?
- ◆ Is it platform specific?
- ◆ Can you bisect it to a specific commit?

Documentation

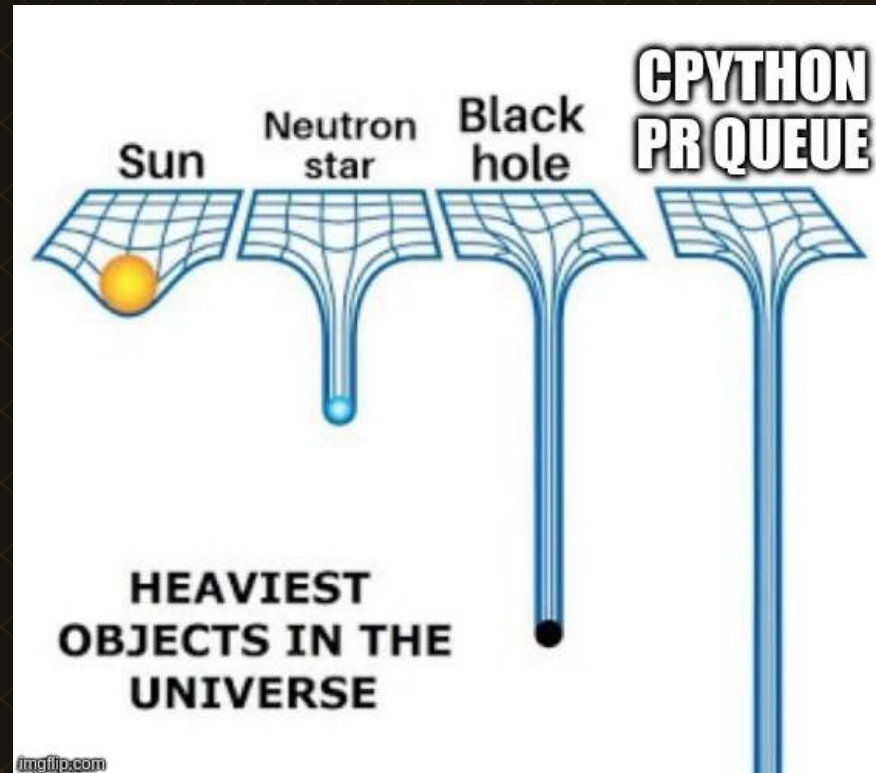

The screenshot shows the Python 3.14.6 documentation page for the `string` module. The page title is "string — Common string operations". The left sidebar contains a "Table of Contents" with links to "string — Common string operations", "String constants", "Custom string formatting", "Format string syntax", "Format specification mini-language", "Format examples", "Template strings (f-strings)", and "Helper functions". Below the table of contents are links for "Previous topic" (Text Processing Services) and "Next topic" (`string.Template` — Support for template string literals). At the bottom of the sidebar are links for "This page" (Report a bug, Improve this page, Show source). The main content area has a "Source code" link for `Lib/string/_init_.py` and a "See also" section with links to "Text Sequence Type — str" and "String Methods". The "String constants" section states that the constants defined in this module are `string.ascii_letters`, `string.ascii_lowercase`, and `string.ascii_uppercase`. It describes `string.ascii_letters` as the concatenation of `string.ascii_lowercase` and `string.ascii_uppercase`, and `string.ascii_lowercase` as the lowercase letters 'abcdefghijklmnopqrstuvwxyz'.

- ◆ Technical content
 - ◆ Grammar, clarity, consistency with other PEPs
 - ◆ Reference implementations
- Great way to stay up-to-date

A word of caution

- ◆ The C in CPython stands for..?

Where to go from here?

- ◆ Join the CPython sprints!
- ◆ Read the Python Dev Guide
- ◆ Take your time

Thank you!
